

Horizon Lines' Refrigerated Cargo Security

Horizon Lines has made a significant effort developing and integrating advanced reefer container security measures.

Rivet fastener. Some of the door hinges have a combination of bolts and a rivet fastener to secure the door to the hinge. The rivet fastener cannot be removed unless it is cut off, which provides a visual alert to a potential problem.

Wire seal through stainless steel bolts. The actual reefer unit itself is bolted into place and wire-sealed to detect entry from the front of the container. This unit cannot be removed without the wire seal being broken.

Each container is equipped with a door lock cam to seal the doors with a high-security seal and prevent entry to the container without detection.

Seal lock slot at base of both doors. The left door cannot be opened without the right door being opened first. The doors cannot be opened unless the security seal in the cam lock is cut.
